

# Download Chrome

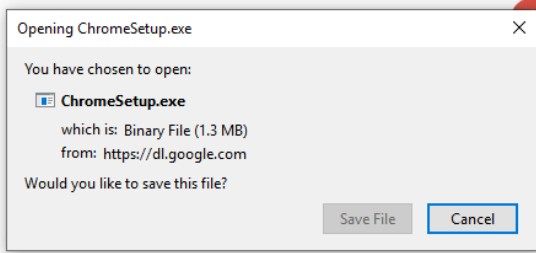

1. Search "download Chrome"

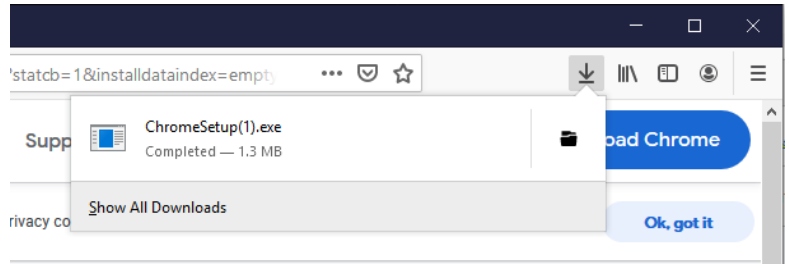

3. Download Chrome

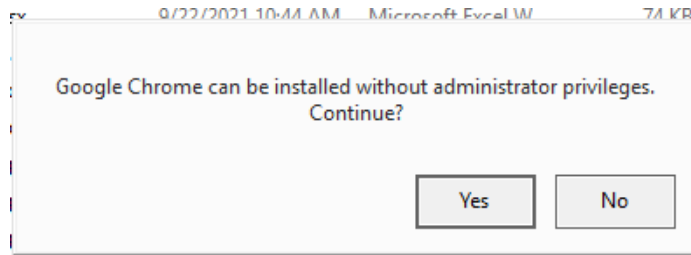

#### 4. Save File

#### 5. Open File

6. Computer beeps at you and asks you to log in. Select Cancel. This pop up will then show up. Click "yes".

And you should be set. You will need to download it onto any new computer you use. If you find you need to download it every day (even though you're on the same machine) the recommended solution is to move the ChromeSetup.exe into local storage. Local storage is where you put things that anyone who uses that computer can access. If that does not fix the problem than it needs to be installed with an installer account.
